TESTIMONIAL: SUSPENSORY LIGAMENT

BY M. BECKMANN, SEPTEMBER, 2016

“My horse, Commander, a 12-year-old world class jumping horse from Germany was lame with both front limb suspensory ligament tears for several years. I had taken Commander to two different equine veterinarians who had treated him with hyaluronic acid, drugs and enhanced feed. Although, Commander would “recover” from his injuries, he would then reinjure himself in his return to competition. For several years, Commander remained in pasture. I was still not willing to give up on his recovery.

In 2006, Dr. Georg Veith, an equine veterinary specialist in lameness and arthritis in the Munich area, examined Commander’s injuries. He told me he had heard of a new equine regeneration therapy formulated by a human orthopedic surgeon, Prof. Dr. Ulrich Schneider, called GOLDIC. Although, Dr. Veith originally thought this GOLDIC product was like IRAP and other products that had failed to regenerate injuries like Commander’s, he decided it was worth a try on my beloved horse.

By now, there was a tremendous amount of scar tissue on Commander’s ligaments. Dr. Veith began the treatment and gave the first GOLDIC injections to both front suspensory ligaments. Commander was subsequently injected in each of the front ligaments once a week for three more weeks. To our absolute amazement, he was completely regenerated. Four to six weeks after the last injection, Commander returned to his training and on to further competing.

Commander, now 22 years old, has not reinjured himself in the last 10 years. Having had a very successful jumping career, I feel you need to know about Arthrogen GOLDIC. Please, see Commander’s complete video story on YouTube:
